**Complex Numbers** are two (2) part numbers:

$$\begin{aligned}z &= \text{Part \#1} + i \text{ Part \#2} \\ &= a + ib = (a, b)\end{aligned}$$

where  $a$  &  $b$  are real numbers and “ $i$ ” is called the imaginary unit – lousy name.

**Imaginary Unit:**  $i = \sqrt{-1}$

**Key:** Positive Integer “ $I$ ” can be written as  $I = 4Q + R$  where  $Q$  is the Quotient and  $R$  is the Remainder satisfying  $0 \leq R \leq 3$ . Hence,

$$i^I = i^{4Q+R} = (i^4)^Q * i^R = 1^Q * i^R = \begin{cases} 1 ; R = 0 \\ i ; R = 1 \\ -1 ; R = 2 \\ -i ; R = 3 \end{cases}$$

We have the following:

$$i = i^1 = \sqrt{-1} \text{ Definition}$$

$$i^2 = -1$$

$$i^3 = i^2 * i^1 = -1 * i = -i$$

$$i^4 = i^2 * i^2 = (-1) * (-1) = 1$$

$$i^5 = i^4 * i^1 = i$$

$$i^6 = i^4 * i^2 = -1$$

**Definitions:** A complex number has the “standard” form

$$z = a + ib = (a, b) \text{ where } i = \sqrt{-1}$$
$$= (\text{Real Part}) + i(\text{Imaginary Part}) = (\text{Real Part}, \text{Imaginary Part})$$

so

"a" = Real Part of z

"b" = Imaginary Part of z

Also

$\bar{z} = a - ib$  = conjugate of z [Change the SIGN of the Imag Part]

&

$$|z| = \sqrt{a^2 + b^2} = \text{magnitude of } z$$

Note: Every real number “x” can be written as a complex number:  $x = x + 0i$

(4) **Question:** Find the conjugate of  $z_1 = 2 - 3i$

**Solution:**

The conjugate of  $\mathbf{a + ib}$  is  $\mathbf{a - ib} = 2 + 3i$ .

(5) **Question:** Find the magnitude of  $z_1 = 2 - 3i$ .

**Solution:**

The magnitude of  $\mathbf{a + ib}$  is  $\sqrt{\mathbf{a^2 + b^2}} = \sqrt{(2)^2 + (3)^2} = \sqrt{13}$ .

Since a complex number  $z = a + ib$  can be considered as the ordered pair  $(2, -3)$ , we can graph it using the Number Plane:

Note: We can think of a complex number as a **vector** since it has a magnitude and direction.

### Operations with Complex Numbers:

Let

$$z_1 = a + ib = 2 + 3i$$

$$z_2 = c + id = -1 + 5i$$

$$\text{Sum: } z_1 + z_2 = (a + ib) + (c + id) = \overbrace{(a + c)}^{\text{Real Part}} + \overbrace{(b + d)}^{\text{Imag Part}}i$$

$$\text{Example: } z_1 + z_2 = (2 + 3i) + (-1 + 5i) = 1 + 8i$$

$$\text{Difference: } z_1 - z_2 = (a + ib) - (c + id) = \overbrace{(a - c)}^{\text{Real Part}} + \overbrace{(b - d)}^{\text{Imag Part}}i$$

$$\text{Example: } z_1 - z_2 = (2 + 3i) - (-1 + 5i) = 3 - 2i$$

$$\text{Product: } z_1 * z_2 = (ac - bd) + (ad + bc)i$$

$$\text{Example: } z_1 * z_2 = (2 + 3i) * (-1 + 5i) = -2 + 10i - 3i + 15i^2 = -2 + 7i - 15 = -17 + 7i$$

$$\text{Quotient: } \frac{z_1}{z_2} = \frac{a + ib}{c + id} = \frac{a + ib}{c + id} * \frac{c - id}{c - id} = \frac{(ac + bd) + (bc - ad)i}{c^2 + d^2}$$

**Example:** 
$$\frac{z_1}{z_2} = \frac{2+3i}{-1+5i} = \frac{2+3i}{-1+5i} * \frac{-1-5i}{-1-5i} = \frac{(2+3i)*(-1-5i)}{(-1+5i)*(-1-5i)} = \frac{-2-10i-3i-15i^2}{1+5i-5i-25i^2}$$

$$= \frac{13-13i}{26} = \frac{1}{2} - \frac{1}{2}i$$

Below are a few more examples in multiple choice format:
