## Rates of Change

MATH by Wilson Your Personal Mathematics Trainer MathByWilson.com  $\begin{bmatrix} \text{MATH by Wilson} \end{bmatrix}$  $\vert$  Vour Personal Mathematics Trainer MathByWilson.com

Recall that there are two (2) types of rates of change:

- 1. Average Rate of Change with respect to an *interval* Difference Quotient
- 2. Instantaneous Rate of Change with respect to a *point* First Derivative

Presently, we are mostly considering instantaneous rates of change, that is, derivative related changes:

Given 
$$
f(x)
$$
, find

1. Average Rate of Change:  $\frac{f(x+\Delta x) - f(x)}{g(x)}$  $\Delta$  $\mathbf{x}$ ) –  $\mathbf{f}(\mathbf{x})$ x 2. Instantaneous Rate of Change:  $f'(x) = \lim_{\Delta x \to 0} \frac{f(x + \Delta x) - f(x)}{\Delta x}$  $\Delta$ x) – f  $x\rightarrow 0$   $\Delta$  $\mathbf{x}$ ) –  $\mathbf{f}(\mathbf{x})$ x

Example 01: Given  $(t) = \frac{2t}{t}$ 2  $=$  $^{+}$  $f(t) = \frac{2t}{t}$ t , find

1. Average velocity on 
$$
[2,2.25]
$$

2. Instantaneous velocity at  $t = 2$ 

Solution:

1. Average Rate of Change: 
$$
\frac{\Delta x}{\Delta x}
$$
  
\n2. Instantaneous Rate of Change:  $f'(x) = \lim_{\Delta x \to 0} \frac{f(x + \Delta x) - f(x)}{\Delta x}$   
\n2. Given  $f(t) = \frac{2t}{t+2}$ , find  
\nAverage velocity on [2, 2.25]  
\nInstantaneous velocity at  $t = 2$   
\n**n**:  
\nAverage Velocity:  $\frac{f(t_0 + \Delta t) - f(t_0)}{\Delta t} = \frac{f(t_1) - f(t_0)}{t_1 - t_0}$   
\nwhere  $[t_0, t_1]$ ;  $\Delta t = t_1 - t_0$   
\n $t_0 = 2$ ;  $t_1 = 2.25 \Rightarrow \frac{f(t_1) - f(t_0)}{t_1 - t_0} = \frac{f(2.25) - f(2)}{2.25 - 2}$   
\n $= ... = \frac{4}{17}$  ft/sec

Instantaneous Velocity:  $f'(t)\Big|_{t=t_0}$ 

Instantaneous Velocity: 
$$
f'(t)|_{t=t_0}
$$
  
\n $f'(t) = 2 \frac{(t+2)^* 1 - t^* 1}{(t+2)^2} = \frac{4}{(t+2)^2}$   
\n $f'(2) = f'(t)|_{t=2} = \frac{2}{8} = \frac{1}{4}$  ft/sec

Instantaneous Velocity:  $f'(t)|_{t=t_0}$ <br>  $f'(t) = 2\frac{(t+2)^*1 - t^*1}{(t+2)^2} = \frac{4}{(t+2)^2}$ <br>  $f'(2) = f'(t)|_{t=2} = \frac{2}{8} = \frac{1}{4} \text{ ft/sec}$ <br>
Example 02: Given  $T(t) = 6 + 3t + \frac{1}{t+2}$   $t \in [0,10]$  where  $T(t)$  in degrees<br>
C'and t in minutes,  $(t) = 6 + 3t + \frac{1}{12}$   $t \in [0,10]$ 2  $= 6 + 3t + \frac{1}{2} t \in \left[ 0 \right]$  $^{+}$  $T(t) = 6 + 3t + \frac{1}{1} t \in$ t where  $\mathbf{T}(\mathbf{t})$  in degrees  $C^{\circ}$  and t in minutes, find  $T'(t)$  at t = 1.  $\Gamma(t) = 2 \frac{1}{t+2i^2} = \frac{1}{t+2i^2}$ <br>  $\int f'(2) = \int f'(t)|_{t=2} = \frac{2}{8} = \frac{1}{4} \int f'(sec)$ <br>
Example 02: Given  $T(t) = 6 + 3t + \frac{1}{t+2}$   $t \in [0,10]$  where  $T(t)$  in degrees<br>
C° and t in minutes, find  $T'(t)$  at  $t = 1$ .<br>
Solution:<br>
Calculat  $\left| \mathbf{t}(t) \right|_{t=2} = \frac{2}{8} = \frac{1}{4} \text{ ft/sec}$ <br>  $= 6 + 3t + \frac{1}{t+2} \quad t \in [0,10] \text{ where } \mathbf{T}(t) \text{ in degrees}$ <br>  $\mathbf{T}'(t) \text{ at } t = 1.$ <br>
teric Derivative:<br>  $\left( t+2 \right)^{-1}$ <br>  $\left( t+2 \right)^{-2} = 3 - \frac{1}{\left( t+2 \right)^2}$ <br>
eric Derivative:<br>  $\frac{1}{t+2} = 3 - \$ 

## Solution:

Calculate Generic Derivative:

$$
T(t) = 6 + 3t + (t + 2)^{-1}
$$
  
\n
$$
\Rightarrow T'(t) = 3 - (t + 2)^{-2} = 3 - \frac{1}{(t + 2)^{2}}
$$

Evaluate Generic Derivative:

$$
T'(1) = 3 - \frac{1}{(1+2)^2} = 3 - \frac{1}{9} = 2\frac{8}{9} \frac{C^{\circ}}{min}
$$

## Example 3: Boyle's Law for Gases

Note: There must always be enough data present to find C:Given  $\mathbf{t}_{0} \Rightarrow$  $C = P(t_0)V(t_0)$ Boyle's Law:  $PV = C = constant$   $P(t) = pressure$ ;  $V(t) = volume$ Note:  $P(t)V(t) = C$ ; C depends upon the gas under consideration Example 3: Boyle's Law for Gases<br>
Boyle's Law:  $PV = C = \text{constant}$   $P(t) = \text{pressure}$ ;  $V(t) = \text{volume}$ <br>
Note:  $P(t)V(t) = C$ ;  $C$  depends upon the gas under consideration<br>
Note: There must always be enough data present to find  $C$ : Given  $t_0 \Rightarrow C$ Boyle's Law: PV = C = constant P(t) = pressure ; V(t) = volume<br>
Note: P(t)V(t) = C ; C depends upon the gas under consideration<br>
Note: There must always be enough data present to find C:Given t<sub>0</sub>  $\Rightarrow$ <br>
C = P(t<sub>0</sub>)V(t<sub>0</sub>)

Hg with  $V(0) = 20$  cm<sup>3</sup> and  $P(0) = 10$ 

Solution:

We have 
$$
C = V(0)P(0) = 20 * 10 = 300 \frac{cm^4}{Hg}
$$
 so that

Note: There must always be enough data present to find C: Given 
$$
\mathbf{t}_0 \Rightarrow
$$
  
\n $\mathbf{C} = \mathbf{P}(\mathbf{t}_0) \mathbf{V}(\mathbf{t}_0)$   
\nFind  $\mathbf{V}'(\mathbf{t})|_{\mathbf{t}=2.5}$  when  $\mathbf{P}(\mathbf{t}) = 10 + 4\mathbf{t} \frac{\mathbf{cm}}{\mathbf{Hg}} \mathbf{t} \in [0,10]$  with  
\n $\mathbf{V}(0) = 20 \text{ cm}^3 \text{ and } \mathbf{P}(0) = 10$   
\nSolution:  
\nWe have  $\mathbf{C} = \mathbf{V}(0)\mathbf{P}(0) = 20 * 10 = 300 \frac{\mathbf{cm}^4}{\mathbf{Hg}}$  so that  
\n $\mathbf{V}(\mathbf{t}) = \frac{300}{10 + 4\mathbf{t}} \mathbf{cm}^3 = 300(10 + 4\mathbf{t})^{-1} \mathbf{cm}^3 \mathbf{t} \in [0,10]$   
\n $\mathbf{V}'(\mathbf{t}) = -300(10 + 4\mathbf{t})^{-2}(4) = -\frac{1200}{(10 + 4\mathbf{t})^2} \frac{\mathbf{cm}^3}{\text{min}}$   
\n $\mathbf{V}'(2.5) = -\frac{1200}{(10 + 10)^2} = -\frac{1200}{400} = -3 \frac{\mathbf{cm}^3}{\text{min}}$ 

**Definition:** Let  $s(t)$  represent the position of a particle at time  $t$ . The velocity of the particle is given by  $\mathbf{v}(\mathbf{t}) = \mathbf{s}'(\mathbf{t})$ . Note:  $v(t) > 0 \implies$  motion upward ;  $v(t) < 0 \implies$  motion downward The acceleration of a particle is given by  $\mathbf{a}(\mathbf{t}) = \mathbf{v}'(\mathbf{t}) = \mathbf{s}''(\mathbf{t})$ 

Example 04: A particle moving vertically has a position defined by

$$
s(t) = 160t - 16t^2 \text{ ft}
$$

 Find its velocity, acceleration, the maximum height it will reach, and its velocity when it hits the ground.

## Solution:

We have

$$
\mathbf{v(t)} = \mathbf{s'(t)} = 160 - 32\mathbf{t} \text{ ft} / \text{ sec}
$$

$$
\mathbf{a(t)} = \mathbf{v'(t)} = \mathbf{s''(t)} = -32 \text{ ft} / \text{ sec}^2
$$

Note the  $\mathbf{v}(3) = 54$  so the motion is upward and  $\mathbf{v}(7) = -54$  so the motion is downward. The velocity is zero at its maximum height:

$$
0 = \mathbf{v}(\mathbf{t}) = \mathbf{s}'(\mathbf{t}) = 160 - 32\mathbf{t}
$$
 ft / sec  $\Rightarrow$  t = 5 sec

Thus, the maximum height is  $s(5) = 160(5) - 16(5)^2 = 400$  **ft**. At the ground  $0 = s(t) = 160t - 16t^2$   $ft \Rightarrow t = 10 \text{ sec so that}$  $v(10) = -160$  ft/sec
